

**Amendments to the Specification:**

Please delete the paragraph beginning on line 3 on page 11:

~~Specifically, the construction of nozzle 20'', shown in Fig. 7A, represents a transverse, schematic, cross sectional view of the Fig. 7 construction, taken through spray tip 32'' at the center line of pivot pins 66. In the Fig. 7C construction of nozzle assembly 20'', even though opposed pin members 66 are similarly outwardly directed as in Fig. 7A, pin members 66 are fixedly received in spray tip 32', thereby shifting the rotational interface to shroud 30'', while, in Fig. 7A, the rotational interface remains with nozzle tip 32'. In the Fig. 7B construction, in order to facilitate the assembly of spray tip 32'', shroud 30' of Fig. 7A may be split into two cylindrical shell portions 30'' (only one being shown) abutting at pin members 66, each shell portion having opposed cylindrical cutouts in order to accommodate pin members 66. Upon completion of the assembly, the split may be closed via a rotational weld. Finally, in the Fig. 7B nozzle construction 21, pin members 66' are preferably integral with spray tip 32'', thereby again shifting the rotational interface to shroud 30'' which, in order to permit assembly is also comprised of two adjoining cylindrical shell portions 30'' in a manner similar to that described relative to Fig. 7C. Thus, the Fig. 7B and 7C constructions are essentially the reverse of the Fig. 7A nozzle construction.—~~
